

UK ATTENTION

Item number: 871125299881
Item number: 401209369229

- This product is capable of using gyroscopic technology in smaller spaces as well as outdoor flying, as long as the wind speed is no more than four and flight requirements are met.
- The aircraft uses the 2.4 GHz band, and has a remote control radius of about 50 metres (at ground level the radius is about 20 metres), and can operate in this way without undue interference. Under remote control this aircraft functions forwards, backwards, fly to the left and right, and left and right steering, using four channels.
- For easier, more skilled and secure operation of this aircraft, please carefully read this manual, and store it safely for future reference.

PART NAMES

BATTERY INSTALLATION

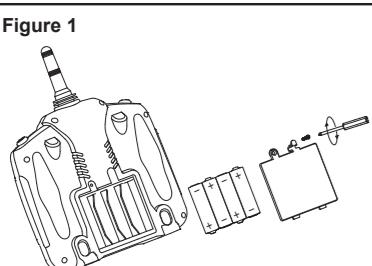

Figure 1: Remove the remote control battery cover. Install four "AA" batteries (sold separately) according to the correct polarities as indicated, replace the battery cover and tighten the screws (optional).

NOTE
1. To correctly install batteries, look for the positive and negative terminals inside the battery compartment, do not install batteries the wrong way round.
2. Do not mix old and new batteries or mix different types of batteries.

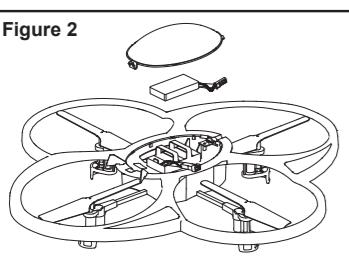

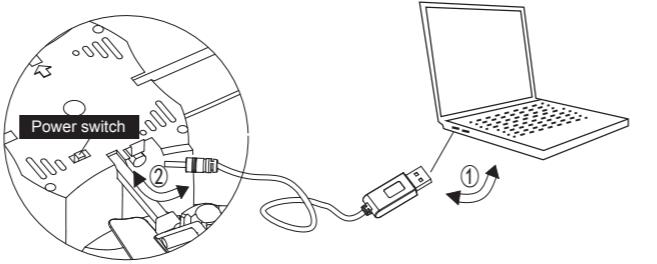

Figure 2: Remove the aircraft's transparent battery compartment cover, ensure that the battery is correctly plugged in and replace the transparent cover.

NOTE
1. When you install a battery, check the battery positive and negative terminals, red should go to red.

BATTERY CHARGING INSTRUCTIONS

- Connect the USB charger to the computer's USB port, the USB indicator light should go on.
- Turn the aircraft power switch to "OFF", and connect the other end of the USB charging cable to the rear vehicle charging port, the USB indicator light should go off.
- After approximately 1 to 2 hours charging, the USB light will go on to indicate charging is complete. Disconnect everything and store safely, and turn off the computer (each charge gives you about 6 minutes of flight time).

NOTES ON USAGE OF LITHIUM BATTERIES

- In the case of misuse, charging the battery may cause fire, bodily injury and property loss. Users must be aware of the risks of using this product. Manufacturers, retailers and dealers do not bear any responsibility if accidents occur, so please carefully read the safety guidelines and charging instructions before operating.
- If battery electrolyte fluid gets into your eyes, do not rub them, but rinse them out with clean water and seek medical advice immediately.
- Please disconnect the plug immediately if there is any unusual smell, noise or smoke.
- Please comply with the following requirements strictly, or there is a risk of fire, electric shock or explosion.
- Charging: Please use the original factory charger to ensure your safety.
- Do not charge a worn-out battery.
- Do not overcharge the battery. Please disconnect the charger once the battery is fully charged.
- Do not charge the battery near to anything inflammable or on a surface which can conduct electricity. You should supervise the battery charging process at all times.
- Do not charge batteries which are still warm to the touch, as this will cause expansion and potentially even a fire risk.
- The charging temperature should be between 32°F and 104°F (0°C - 40°C).

Use and storage:

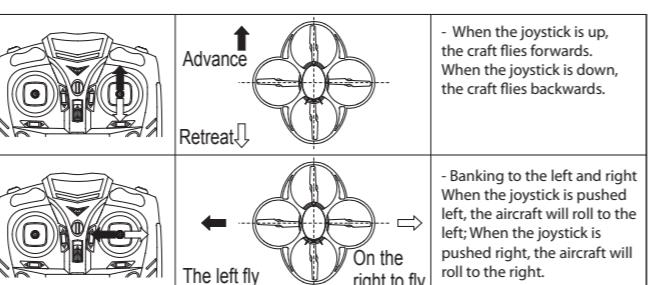

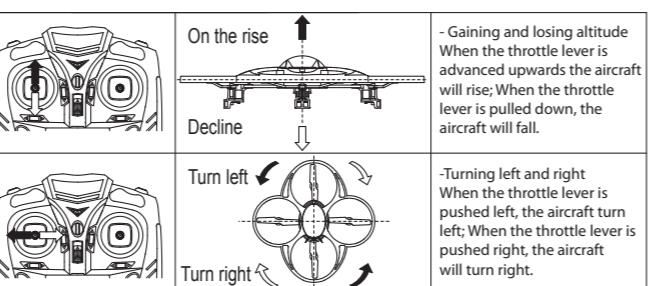

- Do not pack broken batteries with the plastic bag.
- Do not insert/take out batteries while the product is being operated.
- Do not over-expose or knock the batteries.
- Worn-out batteries must never be used.
- Children are prohibited from touching the batteries.
- Do not throw the batteries into a fire or immerse them in any liquid.
- Batteries must never be put in a microwave oven or pressure tank.
- Do not dismantle, drill or cut the batteries.

VEHICLE CONTROL SETUP PROCEDURE

- With the aircraft battery properly connected and the transparent cover replaced, turn the power switch off and put the vehicle on flat ground. The aircraft lights should blink. Do not move the body quickly.
- Confirm the throttle lever is at its lowest setting, turn the remote control power switch so that there are 2 audible beeps, with the aircraft lights flashing, slowly push the throttle lever to maximum and then back to minimum, and there should be another audible sound from the remote control. When the remote control and aircraft power indicator lights light up, the code pairing procedure has been successful and the aircraft is ready for flight.
- When multiple aircraft are flown simultaneously, each one must be individually code paired, to avoid dangerous or unintended results.

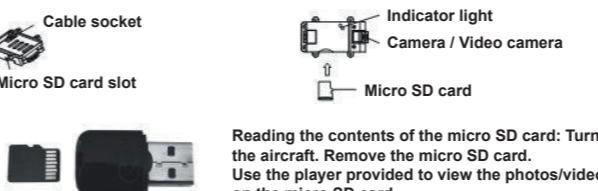

STANDARD FLIGHT CONTROL PROCEDURES

- When the aircraft is in flight, always ensure that the clearance to front and rear and all around extends at least three metres.
- When not operating the aircraft, please unplug the power cable and disconnect the battery to avoid damage to the battery.
- The aircraft lights are blue when going forwards, red when going backwards.

INSTRUCTIONS

- Insert the micro SD card into the slot in the direction indicated on the aircraft, as shown in the figure below. Press the micro SD card with your finger until it clicks into place. Press it again to release it.
- If the blue light remains on and the red light is flashing, that means the aircraft has power but there is no micro SD card in the slot. If, when you press the "PHOTO/VIDEO" button on the radio control, the blue and red lights on the bottom of the aircraft do not respond, the aircraft has power but the synchronization was not successful.
- After you have placed the micro SD card and during use of the product, when you press "PHOTO" button on the transmitter, the red light on the bottom of the aircraft flash one time. This symbol means that the Drone is taking pictures on your command.
- After you have placed the micro SD card and during product usage, when you press the "VIDEO" button on the transmitter, the red light on the bottom of the aircraft is flashing. This symbol means that the Drone is recording. When you press button again, videocamera turns off and the red light stop flashing.
- When you turn the SpaceLight OFF, remove the micro SD card, as described above, and place it in the USB drive as shown in the figure. Connect the USB card reader to any USB port on your PC and download your videos and photos.

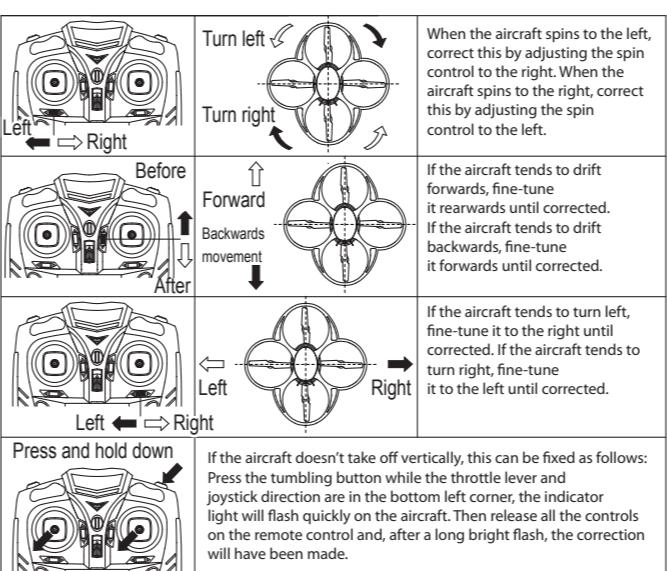

Reading the contents of the micro SD card: Turn-off the aircraft. Remove the micro SD card. Use the player provided to view the photos/videos on the micro SD card.

IN-FLIGHT TRIMMING AND CALIBRATION INSTRUCTIONS

Slowly push the throttle lever when the aircraft has just taken off, or if the vehicle tends to spin in the air in a certain direction, this can be used to fine-tune corrective actions.

NOTE

When the aircraft is flying around 30cm above the ground, the wings' air vortices become turbulent, which is called "ground effect". The lighter the aircraft, the greater the impact of ground effect.

FLYING ENVIRONMENT

- Indoor Flying: choose a wide, open place without barriers, pets or people.
- Outdoor Flying: choose warm, sunny and windless conditions.

NOTICE

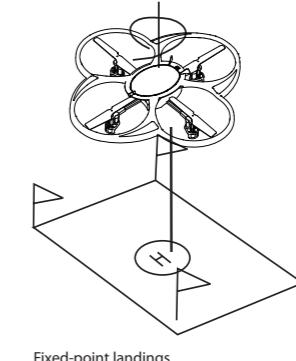

- Do not fly in extreme temperatures. Flying in extreme temperatures may affect performance and damage the aircraft.
- Do not fly in strong winds; strong winds will restrict flight possibilities and your safe flight control. If the aircraft is flown in strong winds, it may be lost or damaged.

PRECAUTIONS

- When the remote control or aircraft power is low, the effective remote control distance will be lessened.
- If the vehicle battery is running low, this will cause problem with gaining altitude and/or take off difficulties.
- If the vehicle is damaged or deformed please repair any severe damage such as a broken rotor so as to avoid injury when flying your craft.
- If the remote control is not used for a long time, remove the batteries prior to this, so as to avoid damage caused by possible battery leakage.
- A sudden drop in altitude or a crash or serious impact will damage the aircraft or shorten its life.
- In order to ensure the stability of the aircraft, when the aircraft hits an object and suddenly drops, place the vehicle on level ground for two seconds until the vehicle automatically detects its orientation, then perform pairing again.

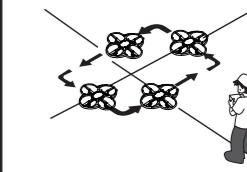

FLYING PRACTICE

Fixed-point revolutions

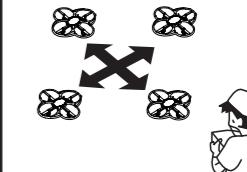

To master your quad-copter, please try the following flying exercises:

- Fly in square patterns

- Fly in cross (X) patterns

First master aircraft take off and landing, then simple rotations and other basic exercises, then try flying in squares and cross-patterns.

PROBLEMS AND SOLUTIONS

Problem	Reasons	Solutions
Power available, but craft uncontrollable	1. Remote control and/or vehicle power supply not working correctly	1. Install the remote control batteries correctly. Ensure the aircraft battery is fully charged and the power is switched "ON", and perform the code pairing procedure again.
	2. Remote control and aircraft have not paired successfully	2. As in the previous solution, pair the units again
Aircraft moves erratically	1. The rotors are deformed	1. Replace the appropriate rotors with new ones
	2. The hollow shaft is bent	2. Replace with a new one
Aircraft takes off to one side	1. The rotor is deformed	1. Replace with a new rotor
	2. The motor is damaged	2. Replace with a new motor
	3. The aircraft was not horizontal when pairing was attempted	3. Place the aircraft on a horizontal surface, pair it up again
The aircraft goes out of control	1. The effective remote control distance has been exceeded	1. Ensure the aircraft stays within the normal distance of 30m
	2. The pairing procedure has resulted in multiple aircraft being simultaneously controlled inappropriately	2. Please recode/re-pair the aircrafts (for multiple aircraft, the pairing process needs to be conducted on each one individually, to avoid ineffective or absent control of the aircraft)
Aircraft does not gain altitude	1. The rotor speed is too low	1. Push the throttle lever up slowly
	2. The aircraft battery is low on power	2. Replace the battery with a fully charged one, or ensure the battery is fully charged before pairing
Aircraft lands too fast	1. The throttle is being pulled back too quickly	1. Allow the aircraft to drop slowly by easing back on the throttle lever

01 Transparent cover

02 The housing assembly

03 The main body

04 Forward motor (red and blue lines)

05 Reverse motor (black line)

06 Electrical compartment assembly

07 Wing components

08 Lithium rechargeable battery

09 2.4 GHz receiver edition

10 Motor cover X 4

11 Carbon tubes

12 USB cable

WARNING

Instructions for use - Hands, hair and loose clothes must be kept away from the propeller (rotor). - Caution! The helicopter should not be started when persons, animals or any objects are within the flying range of the helicopter. - Do not throw or hold any objects in the rotating rotor. - Caution: Risk of eye injuries! Do not fly near your face to avoid injuries. - Age classification: Not suitable for children under 8 years of age. - Before first use: Read the user's information together with your child. - For safe use, the room where the toy is used must be sufficiently large. The room must be free from obstacles (such as lamps, loose objects, etc.). - This toy is intended to be used in domestic area (house and garden) only. - Keep the instructions for use for later reference! - Operations and safe use shall be explained clearly and graphically (preferably by clear illustrations). - Flying the helicopter requires skill and children must be trained under the direct supervision of an adult. - For toys to be assembled by the child: Check if the toy is assembled as instructed. The assembly shall be performed under the supervision of an adult.
